From the Editor’s Desk

Methicillin-resistant Staphylococcus aureus (MRSA) is a serious concern for clinicians managing infectious diseases in the healthcare setting. Trends in S. aureus epidemiology have demonstrated rising rates of methicillin resistance along with gradually decreasing susceptibility to vancomycin (known as “MIC creep”). This can have a significant impact on clinical outcomes and places added pressure on clinicians to optimally utilize antimicrobial agents to maximize effectiveness while minimizing the potential for adverse events.

This is the first of four electronic newsletters that will tackle specific issues related to the management of MRSA infections. In this issue, the role of vancomycin in managing MRSA infections is discussed. The recently released evidence-based guidelines from the Infectious Diseases Society of America (IDSA) offer important recommendations for dosing and monitoring vancomycin to ensure effective and safe levels are achieved. Though vancomycin has been associated with certain adverse events and toxicity, clinicians can take precautions to minimize their potential risk in patients with serious MRSA infections. I hope you find this and subsequent issues to be relevant and useful in your clinical practice.

A Clinician’s Roadmap To MRSA Management  Stewardship for Optimal Care

E-Newsletter #1 Optimized Use of Vancomycin

Target Audience
This activity is designed for physicians, pharmacists, and other healthcare professionals on the frontline of managing patients with serious MRSA infections.

Learning Objectives
Healthcare professionals participating in this educational activity will be able at its conclusion to:

• Determine the optimal use of vancomycin for MRSA infections

• Identify strategies to minimize the risk of vancomycin-associated adverse events

Guest Editor
Thomas M. File, Jr., MD, MSc, MACP, FIDSA, FCCP
Professor of Internal Medicine
Master Teacher
Head, Infectious Disease Section
Northeastern Ohio Universities
College of Medicine
Rootstown, Ohio
Chief, Infectious Disease Service
Director, HIV Research
Summa Health System
Akron, Ohio

Accreditation
Physicians
This activity has been planned and implemented in accordance with the Essential Areas and Policies of the Accreditation Council for Continuing Medical Education through joint sponsorship of Center for Independent Healthcare Education (Center) and Vemco MedEd. Center is accredited by the ACCME to provide continuing medical education for physicians. Center designates this Enduring Material for a maximum of 0.5 AMA PRA Category 1 Credits™. Physicians should claim only the credit commensurate with the extent of their participation in the activity.

Pharmacists
Center for Independent Healthcare Education (Center) is accredited by the Accreditation Council for Pharmacy Education as a provider of continuing pharmacy education. Center has assigned 0.5 contact hours (0.05 CEUs) for this activity.
ACPE Universal Activity Number: 473-999-11-003-H01-P
Type of Activity: Knowledge-based
Release Date: May 11, 2011
Credit Expiration Date: May 11, 2012

Method of Participation and Instruction for Credit
• Review the entire CME/CPE information including target audience, learning objectives, and disclosures.
• Review the entire Newsletter.
• Complete the Post Test, Evaluation, and Credit Application Form (page 10).
  Please note that to receive credit a score of at least 80% on the Post Test is required.
• Mail the completed Form to Vemco MedEd, 245 US Highway 22, Suite 304, Bridgewater, NJ 08807 or fax to (908) 450-3300.
Note: Documentation of credit will be mailed within 6 weeks of receipt of the completed Post Test, Evaluation, and Credit Application Form.

Disclosure of Conflicts of Interest
Center for Independent Healthcare Education requires faculty, planners, and others who are in a position to control the content of continuing education activities to disclose to the audience any real or apparent conflict of interest related to the activity. All identified conflicts of interest are reviewed and resolved to ensure fair balance, objectivity, and scientific rigor in all activities. The faculty is further required to disclose discussion of off-label uses in their presentations.

Disclosure: Guest Editor
• Research funding: Boehringer Ingelheim, Cempra, Gilead, Pfizer, and Tibotec
• Consultant: Astellas, Bayer, Cempra, Cerexa/Forest, Merck, Nabriva, Pfizer, Rib-X, and Tetrephase

Disclosure: Planning Committee
All employees of Center for Independent Healthcare Education and Vemco MedEd have no relevant financial relationships to disclose.

Disclosure of Off-label Use
There is no discussion of off-label use of any product in this activity.

Disclaimer
The opinions expressed in this educational activity are those of the faculty and do not reflect the views of Center for Independent Healthcare Education (Center) and Vemco MedEd. This educational activity may discuss off-label and/or investigational uses and dosages for therapeutic products/procedures that have not been approved by the United States Food and Drug Administration (FDA). Center and Vemco MedEd do not recommend the use of any product/procedure outside of the labeled indications. A qualified healthcare professional should be consulted before using any therapeutic product/procedure discussed. Clinicians should verify all information and data before treating patients or employing any therapies described in this continuing education activity. Please refer to the prescribing information for each product/procedure for approved indication, contraindications, and warnings.

Joint Sponsorship
This activity is jointly sponsored by Center for Independent Healthcare Education and Vemco MedEd.

Commercial Support
This activity is supported by an educational grant from Cubist Pharmaceuticals.

Fee
There is no fee to participate in this activity.

Copyright Statement
Copyright ©2011 Vemco MedEd, LLC. All Rights Reserved. Permission for accreditation use granted to Center for Independent Healthcare Education.

For questions regarding the accreditation of this activity, please contact Center for Independent Healthcare Education at info@jointssponsor.com.
The Evolving Role of Vancomycin

Methicillin-resistant *Staphylococcus aureus* (MRSA) is among the leading causes of drug-resistant hospital-acquired infections in the United States and now accounts for approximately 60% of all *S. aureus* isolated from hospitalized patients.\(^1\) In many cases of serious MRSA infections, vancomycin is considered first-line therapy.\(^2\)

**What is vancomycin “MIC creep”?**
Vancomycin has long been considered the mainstay for serious MRSA infections. While the occurrence of vancomycin-resistant *S. aureus* is rare,\(^3\) some institutions are reporting vancomycin “MIC creep” or an increasing vancomycin minimum inhibitory concentration (MIC) distribution for hospital *S. aureus* isolates.\(^4-6\)

In one report, the UCLA Medical Center re-evaluated over 6000 *S. aureus* isolates collected from 2000 to 2004 for MIC values using uniform microbiological protocols.\(^7\) This study showed an increase in

- the percentage of *S. aureus* isolates with vancomycin MIC of 1 µg/mL (19.9% in 2000 to 70.4% in 2004, \(P<.01\))

- the number of isolates with vancomycin MIC of 2 µg/mL, regardless of whether the isolate was methicillin-resistant or methicillin-susceptible (2 isolates in 2000 to 12 isolates in 2004).

**What are the potential causes for vancomycin “MIC creep”?**
Though the exact cause of vancomycin “MIC creep” is not known, decreased *S. aureus* susceptibility to vancomycin is likely due to (1) overuse and (2) sub-optimal dosing of vancomycin.\(^3\)

**Overuse of vancomycin:** Increasing concern about MRSA in the community setting and hospital-acquired infections has been associated with an increase in the overall use of vancomycin.\(^8\) One study involving 22 medical centers across the United States reported a 43% increase in vancomycin use from 2002 to 2006.\(^8\)

**Sub-optimal use of vancomycin:** Sub-optimal dosing of vancomycin is prevalent.\(^7\) Under-dosing does not eradicate the infection but allows less susceptible *S. aureus* strains, such as heteroresistant vancomycin-intermediate *S. aureus* (hVISA), to survive.\(^9\)
Impact of Vancomycin “MIC Creep” on Outcomes

Vancomycin “MIC creep” has a significant impact on clinical outcomes. For MRSA isolates with vancomycin MIC >1 µg/mL, vancomycin effectiveness diminishes\textsuperscript{10-14} as demonstrated by a decrease in MRSA eradication rates\textsuperscript{13} and an increase in mortality risk\textsuperscript{14} (Figure 1 and Table 1).

These poorer outcomes associated with higher vancomycin MICs can be explained by the pharmacokinetic/pharmacodynamic characteristics of vancomycin. Studies using animal models as well as clinical trials demonstrate that clinical outcomes are dependent on the ratio of the area under the concentration–time curve to MIC (AUC/MIC).\textsuperscript{15, 16}

An AUC/MIC ≥400 is predictive of optimal clinical response for MRSA infections.\textsuperscript{17} Recent evidence-based guidelines recommend achieving a vancomycin serum trough concentration of 15–20 µg/mL when treating serious MRSA infections.\textsuperscript{2} By attaining these trough levels, an AUC/MIC ≥400 will likely be reached for isolates with vancomycin MIC <1 µg/mL.\textsuperscript{18} However, the probability of attaining an AUC/MIC ≥400 decreases dramatically for MRSA isolates with vancomycin MIC ≥1 µg/mL, even with higher vancomycin dosing regimens (Figure 2).\textsuperscript{18}

Given this association between higher vancomycin MICs and poorer outcomes, the Clinical and Laboratory Standards Institute (CLSI) and the Food and Drug Administration changed the vancomycin susceptibility breakpoints for \textit{S. aureus} (Table 2).\textsuperscript{19}

Optimal Dosing of Vancomycin

Two recent evidence-based guidelines specify dosing recommendations for vancomycin. These include “Therapeutic monitoring of vancomycin in adult patients: a consensus review of the American Society of Health-System Pharmacists, the Infectious Diseases Society of America, and the Society of Infectious Diseases Pharmacists” released in 2009 and “Clinical practice guidelines by the Infectious Diseases Society of America for the treatment of MRSA infections in adults and children” released in 2011 (Table 3).2,20

**Weight-based Dosing**
Vancomycin dosing should be based on actual body weight. This is particularly important when treating overweight patients as they are likely to be underdosed with traditional vancomycin dosing regimens (such as 1 g q12h).21

**Loading Dose**
A loading dose may be considered for serious infections to hasten achievement of target trough serum concentrations. Though clinical data on the effectiveness of loading doses is lacking, a small clinical study determined that a 25 mg/kg vancomycin loading dose is generally safe.22

**Dosing in Children**
Data on vancomycin dosing in children are limited. IV vancomycin 15 mg/kg/dose every 6 h is recommended in children with serious or invasive disease.2 Pharmacokinetic data suggest that such doses (60 mg/kg/day) are needed to achieve an AUC/MIC ≥400 for most MRSA isolates (ie, when vancomycin MIC is ≤1 µg/mL).23

</tbody>
</table>

Effective and safe vancomycin therapy depends on appropriate dosing. While dosing vancomycin, it is important to remember that vancomycin pharmacokinetics can be influenced by patient renal function and concomitant medications.\textsuperscript{24} Vancomycin is predominantly eliminated from the body through the kidneys. As renal function decreases, vancomycin exposure increases warranting dose adjustment.\textsuperscript{24} Concomitant medications with potential for nephrotoxicity (eg, amphotericin B, aminoglycosides) or alteration in renal function (diuretics) can also impact vancomycin elimination.\textsuperscript{24}

Therapeutic drug monitoring is, therefore, critical in ensuring that effective and safe vancomycin concentrations are attained. The IDSA guidelines recommend that trough vancomycin monitoring is an accurate and practical way to guide therapy since the trough concentration is predictive of AUC/MIC (Table 4).\textsuperscript{2}

Vancomycin-Associated Adverse Events

Adverse events associated with vancomycin include neutropenia, fever, phlebitis, nephrotoxicity, ototoxicity, thrombocytopenia, and infusion-related reactions (including Red Man Syndrome—flushing of the face, neck, and chest linked to rapid infusion). While fever, chills, and phlebitis were more frequently observed with the earlier formulations of vancomycin that had larger amounts of impurities, today's main concerns are greater risk of toxicity, particularly nephrotoxicity, associated with higher dosing of vancomycin.

Nephrotoxicity

Incidence of nephrotoxicity is generally low with vancomycin dosing of up to 2 g/day. However, the risk for nephrotoxicity increases once vancomycin dosing reaches 4 g/day (correlating to higher trough serum concentrations) or when vancomycin is used concomitantly with other nephrotoxic agents, such as aminoglycosides.

A retrospective cohort study compared clinical outcomes and nephrotoxicity in patients with low (<15 µg/mL) versus high (>15 µg/mL) vancomycin trough concentrations. High vancomycin trough concentrations were associated with higher mortality and nephrotoxicity (Figure 3).

Lodise and colleagues evaluated the association between initial vancomycin trough concentrations and nephrotoxicity among 166 patients (Figure 4). Multivariate analysis demonstrated that vancomycin trough concentration was the best pharmacodynamic indicator for risk of nephrotoxicity.

Ototoxicity

Higher vancomycin dosing is associated with an increased risk of ototoxicity as well. In a study of 89 patients, high vancomycin doses increased the risk of high-frequency hearing loss. The rate of ototoxicity was greater for older patients (>53 years), with longer exposure to the drug (about 28 days), and with higher trough concentrations (mean, 19 µg/mL). Further studies are needed to better understand the clinical implication of these findings and the reversibility of these effects.
Minimizing The Risk Of Vancomycin-Associated Adverse Events

As clinicians, we can take some steps to minimize the risk of adverse events when using vancomycin.

1. Increase the duration of infusion to decrease the risk of infusion-related reactions and Red Man Syndrome.

2. Evaluate all other concomitant agents for their potential for nephrotoxicity, particularly aminoglycosides.

3. Monitor changes in renal function to detect early signs of toxicity and act accordingly.
   - Consider altering the dose to target a lower trough concentration (10–15 µg/mL instead of 15–20 µg/mL).
   - Consider terminating treatment with concomitant nephrotoxic agents.
   - Switch from vancomycin to another effective anti-MRSA agent as per guideline recommendations.

4. Monitor vancomycin trough concentrations to ensure that effective, yet safe, levels are attained with the current dosing regimen.

Instructions for Credit

1. Review the entire CME/CPE information including target audience, learning objectives, and disclosures.
2. Review the entire Newsletter.
3. Complete the Post Test, Evaluation, and Credit Application Form. Please note that to receive credit a score of at least 80% on the Post Test is required.
4. Mail the completed Form to Vemco MedEd, 245 US Highway 22, Suite 304 Bridgewater, NJ 08807 or fax to (908) 450-3300.

Post Test  Please select the most appropriate response.

1. Possible causes of "MIC creep" include:
   - [ ] Overuse of vancomycin
   - [ ] Sub-optimal dosing of vancomycin
   - [ ] More restricted use of vancomycin
   - [ ] Overuse of and sub-optimal dosing of vancomycin

2. According to the new CLSI vancomycin interpretive breakpoints, MIC of susceptible S. aureus isolates is:
   - [ ] ≤0.5 µg/mL
   - [ ] ≤1 µg/mL
   - [ ] ≤2 µg/mL
   - [ ] ≤4 µg/mL

3. What PK/PD parameter is predictive of optimal clinical response with vancomycin for MRSA infections?
   - [ ] AUC ≥400
   - [ ] AUC/MIC ≥400
   - [ ] Cmax ≥50 µg/mL
   - [ ] Cmax/MIC ≥25

4. According to the IDSA guidelines, what is the appropriate vancomycin trough concentration for serious MRSA infections?
   - [ ] 5 µg/mL
   - [ ] 15 µg/mL
   - [ ] 25 µg/mL
   - [ ] 50 µg/mL

5. When is vancomycin trough serum concentration monitoring recommended?
   - [ ] Those with serious infections and morbidly obese
   - [ ] Those with serious infections and renal dysfunction
   - [ ] Those with serious infections and fluctuating volumes of distribution
   - [ ] All of these

Overall Evaluation

1. The following learning objectives were achieved.
   - [ ] Determine the optimal use of vancomycin for MRSA infections
   - [ ] Identify strategies to minimize the risk of vancomycin-associated adverse events
2. The content was relevant to my practice and educational needs.
3. The activity format enhanced achievement of learning objectives.
4. This activity was fair, balanced, and without commercial bias.
   - [ ] Yes
   - [ ] Somewhat
   - [ ] No
   If you answered "No" to any of the above, please explain.

5. Quality of Guest Editor.
   - [ ] Excellent
   - [ ] Good
   - [ ] Fair
   - [ ] Poor

6. Do you have (1) any suggestions for improving this activity or (2) any additional comments?

Commitment To Change

As an accredited provider of continuing education, Center for Independent Healthcare Education is increasingly focusing on the outcomes of our offerings, particularly as reflected in changes and improvements in clinical practices. Accordingly, we are now asking our learners to reflect on how they might alter their practices as a result of participating in our CE activities.

The following request solicits your commitments to change, based on what you have learned. We hope that you will find this exercise useful and thank you in advance for participating.

Do you wish to make commitments to change in your practice?
   - [ ] Yes
   - [ ] No

As a result of what I learned participating in this activity, I intend to make the following practice changes:

Credit Application (Please Print)

Name _______________________________ Degree _______________________________

Practice setting [ ] Community [ ] Hospitals [ ] Others (specify) ______________________________________

Address ____________________________________________________________ City ______________________________ State _______ ZIP _______

E-mail address ________________________________________________________ May we contact you by e-mail? [ ] Yes [ ] No

Type of credit requested [ ] Pharmacists [ ] Physicians [ ] Others

I certify that I have reviewed the entire newsletter and claim a total of ____________ credit (maximum allowed credit: 0.5 contact hours).

Signature _______________________________ Date ______________________________
